July 5th, 2006

2nd International Conference on Intelligent Environments

1. Introduction
2. Multi User Publishing Environment (MUPE)
3. Context Information Sources
4. Application Design and Implementation Process
5. Examples of Applications Developed
6. Results of The Study
7. Conclucions

# Introduction

- ▶ Location aware applications are commonly used
  - ▶ Navigation (e.g. TomTom, Route66), searching for services (e.g. google maps), routes, restaurants
- ▶ Location easy to understand for game developers
  - ▶ Mapping real world to virtual world
  - ▶ Location as input data
- ▶ Other contexts still straight-forward in sense of data types
  - ▶ For example weather: wind speed and direction, humidity. . .
- ▶ But what entities and how should this information affect?
  - ▶ Nature of context data: e.g. speed of change slow in weather, although it is highly spatial

# Research questions

- ▶ Given a context information supporting platform and a focus on context-aware applications: what kind of context aware application would be developed?
- ▶ Are other context information sources as usable as location information?
- ▶ Study the feasibility of the platform for application development

# Overview of the study

- ▶ A 5 days long intensive course on context-aware game development was arranged
- ▶ Offered to master level students
- ▶ Hands-on intensive development
- ▶ Develop a context-aware game in groups of 2-3 people
- ▶ Lectures on game design, MUPE programming and context-awareness

## Related work

- ▶ Location information in game applications such as
  - ▶ Pirates!<sup>1</sup>, ARQuake<sup>2</sup>, The Journey<sup>3</sup>
  - ▶ *Fun, no accurate context recognition*
- ▶ Development platforms
  - ▶ Context toolkit: widgets to mediate context information
  - ▶ Phidgets: physical user interfaces
  - ▶ ARToolkit: Augmented Reality applications
  - ▶ MIDAS: Integration of external devices to Macromedia Director

# Multi User Publishing Environment (MUPE)

- ▶ A client-server platform with focus on applications on the mobile phones
- ▶ Client:
  - ▶ Java J2ME client
  - ▶ Scriptable user interface created with XML documents
  - ▶ XML protocol: modify UI and notify events to server

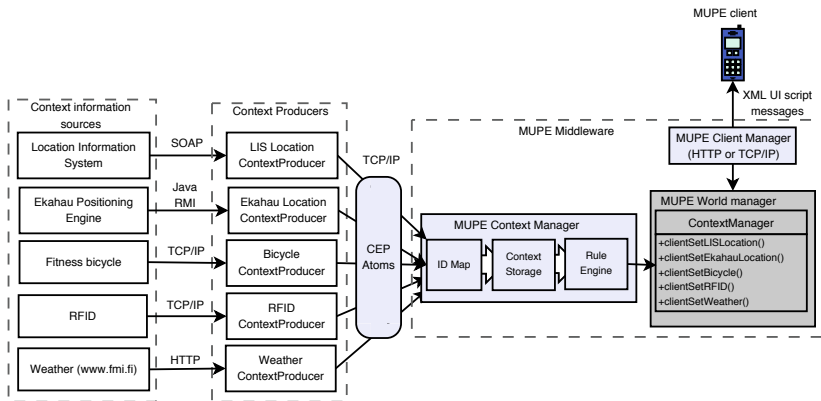

# Multi User Publishing Environment (MUPE)

## Server:

- ▶ Java server for application logic
- ▶ Stores and serves XML UI documents
- ▶ Middleware components for
  - ▶ Client connections
  - ▶ Context information reception
- ▶ Context information presented with *Context Exchange Protocol* (CEP)
- ▶ Scriptable context event system: filter and fire events from context data

# Context Information Sources

# Location information

- ▶ Location Information System (LIS)
  - ▶ Cell id/description based location information from a WLAN network
  - ▶ SOAP interface for queries and tracking events
- ▶ Ekahau Positioning Engine (EPE)
  - ▶ Map, room, x/y -based location information from a WLAN network
  - ▶ Signal fingerprinting: compare current signal measurements to calibrated signal fingerprint of an area
  - ▶ Java RMI based SDK for push -like location information reception
- ▶ RFID
  - ▶ Access 7 RFID readers and passive tags were used
  - ▶ Tag sightings were read with a dedicated application through a serial port

# Weather and Physiological information

- ▶ Weather information service of the Finnish Meteorological institute was used
  - ▶ Wind speed and direction, temperature, humidity, cloudiness and air pressure measurements once per hour
  - ▶ Data in HTML page: parse it and serve to MUPE with CEP (job of the context producer component)
- ▶ Tunturi recumbent fitness bicycle provided...
  - ▶ Heart rate and speed of the bicycle
  - ▶ The data was read with dedicated program through a serial port
  - ▶ A context producer component provided the data to MUPE with CEP

# Application Design and Implementation Process

- ▶ Day 1: Game design patterns<sup>4</sup>
- ▶ Day 2: Tutorial to MUPE
- ▶ Day 3: Introduction to context-awareness setup
- ▶ Day 4: Current and past context awareness project lectures
- ▶ Day 5: Final application presentations

14 game applications developed by 38 students

---

<sup>4</sup>Bjork and Holopainen 2003

# Examples of Applications Developed

## Snow war

- ▶ Wall blocks mapped to locations on floors (leftmost)
- ▶ Two minigames: shooting and defending (center and right)

# Examples of Applications Developed

## Pre-emptive strike

- ▶ Build a bomb from peaces found around the game area to blow the base of the opposing team
- ▶ Steal bomb peaces from opposite players by moving close to the player

# Results of The Study: Platform

- ▶ Setup for using context information in the platform not optimal
- ▶ Possible solutions
  - ▶ Observer pattern: provide a context interface and registration mechanism
  - ▶ Template method: override default implementation with inheritance
- ▶ Difficulty in dividing logic between context scripts and application server

## Results of The Study: Context Awareness

<b>Context source</b>	<b>Usage (%)</b>
LIS (cell location)	0
EPE (floor/room/x,y location)	78,6
Fitness bicycle (speed)	21,4
Fitness bicycle (heart-rate)	7,1
Weather	21,4
RFID	0

**Table:** Context usage distribution

- ▶ Location most used
  - ▶ Especially room location: ready, meaningful data for the applications
- ▶ Personal context information most wanted
  - ▶ e.g temperature of the phone was also requested
  - ▶ Weather + location: connection should have been provided to the developers

# Results of The Study: Game Design

- ▶ Most of the developed games were fast paced, fairly physical in nature
  - ▶ Quickest to attack, collect, locate etc. wins
  - ▶ Game input needed fast player movement
- ▶ 4 applications used two context sources → focused design
  - ▶ One clear game input
  - ▶ Due to time limits
- ▶ Longer lasting game sessions were not considered
  - Game session length affects to the choice of contexts

# Conclusions

- ▶ MUPE was used together with three context information sources to design and implement game applications in a rapid fashion
  - ▶ Location (cell, floor, room, x/y)
  - ▶ Environmental (weather)
  - ▶ Physiological (heart-rate, bicycle speed)
- ▶ Location information most used (technically superior, easy to understand)
- ▶ Usage of other environmental context data would still be more valuable
  - ▶ Longer game sessions, more variation in context data
  - ▶ Active participation should be minimized
